On my two machines on Linux the ~/.config/vicerc (Windows might have a
vice.ini instead) there is a Linux

Directory="/usr/lib/vice/data/C64/"

Hard to google for "Directory=" as the "=" apparently is ignored.

What is this doing? Telling the emulator where roms (kernal, basic
chargen and such) are?

I was looking for a starting directory for disk/tape/cartridge files
instead, so the file browser would not every time start at ~/ when trying
to attach a file to load. Is this possible?
