I own a Color Computer and I run with the OS/9 operating system. I have recently installed a 128K modification from DSL Computer products, and have been able to use it successfully from Disk Extended Basic.

What I am looking for is source code to make use of this 128K modification from OS/9. I would be interested in either a device driver/descriptor which would use this extra 64K as a ram disk or source code patch to OS/9 which would allow it to use the entire 128K as online memory area (this is probably more difficult task).

Please send any information concerning source or where I can get source to use this 128K from OS/9 on my Color Computer.

Thank you.
