Has anyone out there developed a terminal emulator that lets an Apple run Emacs over a dialup?
My system is a 48k Apple][w/ DC Hayes Micromodem, and the system I'm talking to is a Vax 750 w/ 4.2BSD.

Thanx,
Dieter Muller

You can use Ascii Express Professional, with an 80-col. board, emulate a VT52, and use EMACS. I am using it here at ecsvax, and also on a Prime under PRIMOS, and both EMACS versions work fine with my Apple II+.
